Recycling light

Mindful Design.

Sustainable design of lighting products from day one. Design the products to have least number of parts to help reduce waste materials or non-recyclable parts.

Don't lose it.

RE:Use It, is the principle behind our recycle and refurbish moto. Its quiet simple, why throw away yesterday's lighting solutions and instead give them a new lease of life with latest technology.

Therefore reduce materials that go waste and slow global resource consumption, when they are perfect usable and can be re used.

We understand that some materials are not possible to be re used, that where possible.

Packaging.

Ensure all our products are packaged with environmentally friendly materials that can be either returned to P&A to be reused again or recycled locally.

Instead of printing product installation instruction, at P&A we are rolling out the use of a QR code on the back of each product so that they can be downloaded digitally.

Materials.

We understand that within the lighting industry that some materials can only be sourced via a global supply chain. That's why at P&A we aim to use where possible locally sourced materials and components to help reduce and offset this carbon footprint.

Efficiency.

Ensure all our products are energy efficient, delivering improved light quality, high performance and help meet your net zero goals.

Simple steps in reducing your carbon footprint will help all of us meet the UK target of net-zero by 2050.
